

"Hello World" tutorial

(29.12.2014 / Pythonista v1.5)

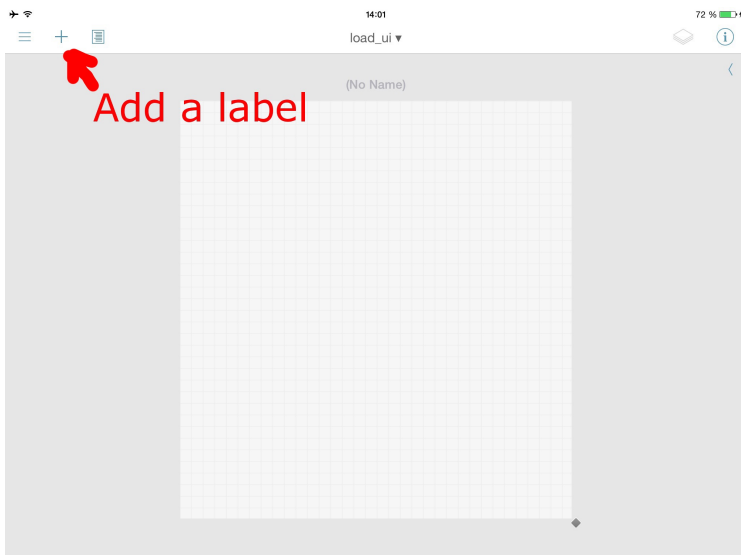

1.) Create a "Script with UI"

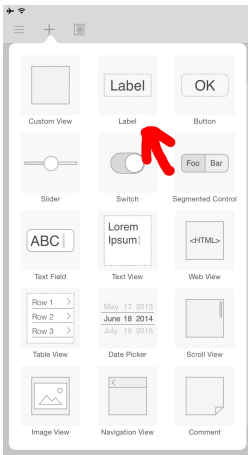

2.) Change the script name to load_ui. Then add the two lines code (view...) and press the button of the UI Designer.

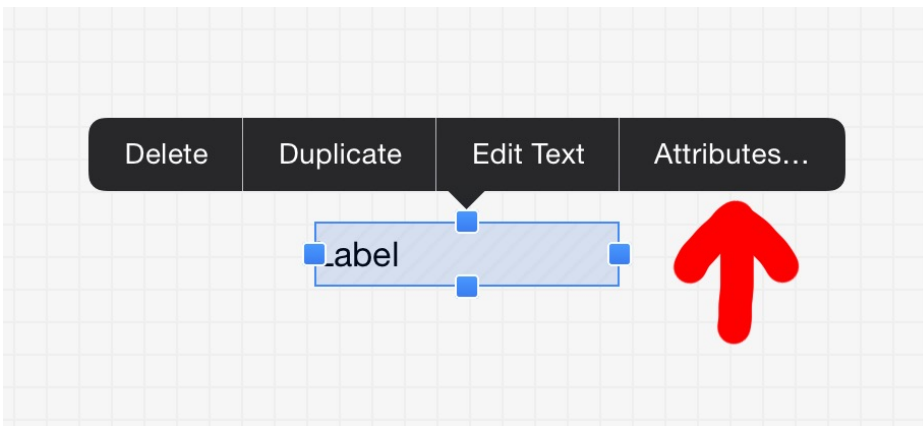

3.) Add a label.

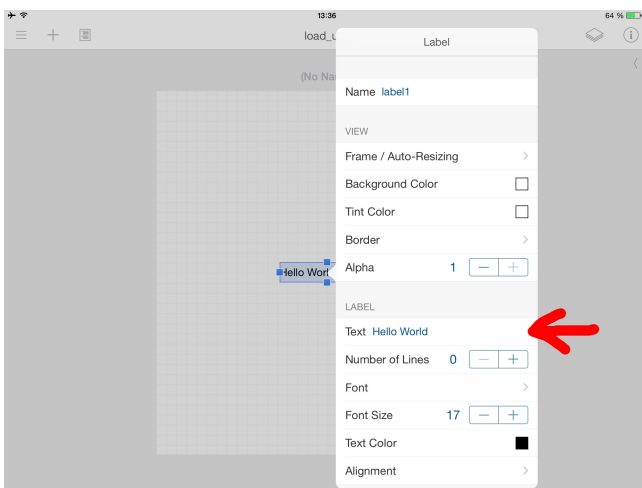

4.) Push the label for the context menu and choose "Attributes..."

5.) Change the label to "Hello World".

6.) Go back to the Code Editor and start your script.

Q: What's the difference between the label name and label text?

A: Access the GUI Element in your code via the name. But the text is what you see on the screen.
